

AUREN

Generate Video Shots: A1 to A2

Use Seedance 2.5 to create a 5-second, 16:9 shot, starting exactly on A1 and ending on A2. A stabilized camera at eye height glides along the checkerboard garden path, then slowly turns right. The pavilion appears naturally between the flowering trees; approach through its open columns until the pink-coated marble statue fills the final composition. Keep the path, flowers, sunset, and pavilion spatially connected. First-person viewpoint, but no visible person, hands, feet, footsteps, or camera bob. No cuts, morphing, teleporting, or movement through objects. (we do not need any audio)

Generate Video Shots: A2 to A3

For the next shot Use Seedance 2.5 to create a 5-second, 16:9 shot from A2 to A3. Start on the pink-coated statue. The camera turns left around it, revealing the

mansion already standing beyond the pavilion columns and garden. Glide between the columns and forward along the checkerboard path until the mansion matches A3. Keep the pavilion visible at the edge as it falls behind the camera; keep the house fixed in the distance as it grows larger through real forward movement. One continuous, stabilized eye-level camera. No scene replacement, appearing or vanishing objects, morphing, cuts, visible body, or footsteps. (we do not need any sound effects or audio)

Generate Video Shots: A3 to A4

For the next shot Use Seedance 2.5 to create a 5-second, 16:9 shot from A3 to A4. Move straight up the front steps toward the mansion's central glass doors. Show the gallery through the entrance before crossing it; the doors must open on their hinges or have a visible gap. Glide across the threshold, then turn gently toward the red-coated statue until the view matches A4. The façade stays behind the camera and the interior is revealed only through the doorway. Continuous eye-level camera; no walls crossed, room swaps, cuts, morphing, visible body, or footsteps.(we do not need any sound effects or audio)

Generate Video Shots: A4 to A5

For the next Use Seedance 2.5 to create a 5-second, 16:9 shot from A4 to A5. Start facing the red-coated statue, then glide left past it toward the doorway visible behind it. As the camera approaches, reveal a short corridor and the burgundy café through an open doorway. Enter, turn toward the seated pink-clothed statue, and finish on A5. Keep the gallery behind the camera and every statue fixed in its own location. The café must be seen through the opening before the camera enters. No sudden background changes, disappearing objects, cuts, morphing, visible body, or footsteps.(we do not need any sound effects or audio)

Generate Video Shots: A5 to A6

For the next Use Seedance 2.5 to create a 5-second, 16:9 shot from A5 to A7. Start in the café, glide forward past the seated statue, then turn right to reveal a doorway farther along the wall; do not turn the existing window into a door. Enter a small white antechamber. Ahead, an open door reveals the white-and-gold hall and blue-coated statue from A7. Move through that door and settle on A7's exact view. Keep both rooms fixed and reveal each through its doorway before entering. Smooth, stabilized eye-level camera; no cuts, morphing, objects appearing or disappearing, visible body, or footsteps.(we do not need any sound effects or audio)

Generate Video Shots: A6 to A1

For the next Use Seedance 2.5 to create a 7-second, 16:9 shot from A7 to A1. Start on the blue-coated statue, then move left and turn left to reveal an exit door. Show A1's flowering garden and checkerboard floor through the open doorway before crossing it. Glide outside, turn naturally, and finish on A1's exact original view for a seamless loop. The hall remains intact behind the camera; the garden never replaces it. Smooth eye-level movement, with no cuts, morphing, sudden appearances, visible body, or footsteps.(we do not need any sound effects or audio)

Build the AUREN homepage & scroll-controlled video

Build the **AUREN homepage hero from scratch** using the attached **A1(2).png** as its opening background and **0925(3).mp4** as the scroll-controlled video. AUREN is a luxury clothing brand that blends classical sculpture with modern streetwear.

Create a full-screen editorial opening: minimal transparent navigation, a large **AUREN** wordmark, the line **"Classic roots. Modern attitude."**, an **Explore Collection** button, and a subtle scroll cue. Use elegant ivory typography with restrained gold details, keeping the garden and checkerboard path visible.

On the first scroll, smoothly fade the image, navigation, headline, button, and scroll cue while revealing the video underneath. Pin the hero and map scroll progress to the full video, forward and backward. Use eased scroll and gently interpolate video time so playback continues briefly toward its target when scrolling stops, then settles naturally—no snapping or independent autoplay. Match the opening image to the video's first frame for a seamless handoff.

Add restrained text that appears only when its scene is visible: **"Enter the world of AUREN"** at the mansion, **"Heritage, reimagined"** in the gallery, **"Everyday, elevated"** in the café, and **"Made to be remembered"** in the marble hall. Keep text away from the statues and fade it between scenes. At the final garden view, reveal **Explore the Collection**, then unpin into the next section. Mute the video, make scrubbing responsive in both directions, optimize it for smooth web playback, and provide a reduced-motion fallback.

Update the AUREN card section

Update the AUREN card section shown in the screenshot. Replace the images on the two existing cards with the uploaded visuals, then add three more cards for five total. Keep the current image size, cream background, typography, and captions beneath each card. Pin the section while scrolling: cards should enter from the bottom right, move diagonally toward the top left with a slight tilt, then fade out as they leave. Fade new cards in smoothly, keep captions attached, and make the animation reversible and responsive without a horizontal scrollbar.

Add a new AUREN section

Add a new AUREN section directly below “Past meets present” and before “The Philosophy.” Use the image I attach as a centered 9:16 portrait card with rounded corners on the site’s existing cream background. Keep the statue centered with object-fit: cover, and place a few restrained editorial labels around the corners, matching the current typography.

Pin the section as the user scrolls. Fade and gently blur the surrounding labels while the image smoothly expands to fill the viewport in 16:9. Reveal the image’s wider sides as it grows—do not stretch or distort it—and gradually remove the rounded corners. Once full-screen, fade in “The art of being seen.”, a short line about AUREN’s classical roots and modern style, and an Explore the Collection button. Use subtle text shadows for readability. Make the animation smooth in both scroll directions, responsive, and let it flow naturally into The Philosophy section.

Add Back-Music

Create an original music, seamless instrumental loop for AUREN: elegant, cinematic, and understated, blending soft classical strings or piano with subtle modern ambience. No vocals, footsteps, or distracting effects. Add it to the website at a gentle volume with a small fixed sound toggle that animates between on and off states. Start with sound off; play only after the visitor turns it on. Keep the toggle accessible and the music continuous as they scroll.

Add subtle cursor-following parallax

Add subtle cursor-following parallax to the AUREN website’s opening hero image, scroll-driven hero video, featured cards, and large images in other sections. Keep every image inside its existing clipped frame; scale images roughly 105–110% and move them gently opposite the cursor with smooth easing. Give cards a very slight tilt for depth. Preserve the current layout, text, scroll animations, video

timing, and the image-to-video transition. Apply cursor movement to a separate visual layer so it never overrides the video's scroll control. Tune movement and scale per image to prevent exposed edges or awkward cropping. On touch devices or when reduced motion is enabled, keep visuals centered and still; smoothly recenter them when the cursor leaves. The result should feel restrained and premium, like the reference recording.
